

ACTIVITY 1: Creating the Account Class (Entity/Model Class)

Objective

Create a pure Account entity class that only manages account data using boolean returns for success/failure.

Requirements

Fields

Create a class Account with the following private fields:

Field	Type	Description
accountNumber	int	Unique account number
name	String	Account holder's full name
age	int	Account holder's age
balance	double	Current account balance
accountType	String	Type of account ("Savings" or "Current")
status	String	Account status ("Active" or "Inactive")

Constructor

Create a constructor that:

- Accepts: accountNumber, name, age, initialBalance, accountType
- Sets all fields with the provided values

- Sets status to "Active" by default

Methods

Method	Parameters	Return Type	Description
deposit	amount (double)	boolean	Returns true if successful, false if amount ≤ 0
withdraw	amount (double)	boolean	Returns true if successful, false if insufficient balance or invalid amount
getAccountNumber	None	int	Returns account number
getName	None	String	Returns account holder's name
getAge	None	int	Returns account holder's age
getBalance	None	double	Returns current balance
getAccountType	None	String	Returns account type
getStatus	None	String	Returns account status
setName	name (String)	void	Updates account holder's name
setAge	age (int)	void	Updates account holder's age

Important Notes

- **NO display methods** - pure entity class
- Methods return boolean to indicate success/failure
- No exceptions thrown

Task

Write the complete Account class in a file called Account.java.
